

## Transcript: Google Scholar

---

A typical Google search only gets you to material that is freely available on the web. The databases and electronic journals that UNB Libraries subscribe to are part of what's called the "deep web." Google won't get you there.

Google Scholar tracks journal articles from many scholarly publications found through citations in web pages, journal publishers, conference proceedings, and some eBooks. If you want to use Google for university-level research, use Google Scholar.

Google Scholar will give you access to full-text articles provided by UNB Libraries, if you access it from the library's homepage ([lib.unb.ca](http://lib.unb.ca)) and select Google Scholar from the list in the Article Databases tab.

OR

You can easily configure your settings in Google Scholar so that UNB Libraries' holdings are linked directly.

Before you start your search, click the top-left menu and select **Settings**. Choose **Library Links**, search for *University of New Brunswick* and **Save** your settings. Now, when you search in Google Scholar, you will see Check for fulltext @ UNB as a link for some citations.

Use the Advanced Search option in the top left to refine your search in different ways.
